

TRANS-FIL INDUSTRIAL EQUIPMENT

Your Trusted Partner
in Filtration Solutions

State-of-the-art solutions in industrial filtration for the tube-mill industry.

Our company leverages over 30 years of experience as leaders in enhancing industrial efficiency through innovative filtration technologies.

Discover our Innovative Line of Automated Filtration Systems:

Durability:

Prolong the life of your tooling up to 50%, reducing maintenance and replacement costs.

Efficient Automation:

Simplify operations, reduce manual intervention and improve efficiency.

Reduce costs:

Eliminate impurities, lower operational expenses, and minimize coolant consumption.

Exceptional Quality::

Our assurance of superior product finishing is underpinned by the essential role of filtration.

Tube-Mill Filtration Solutions.

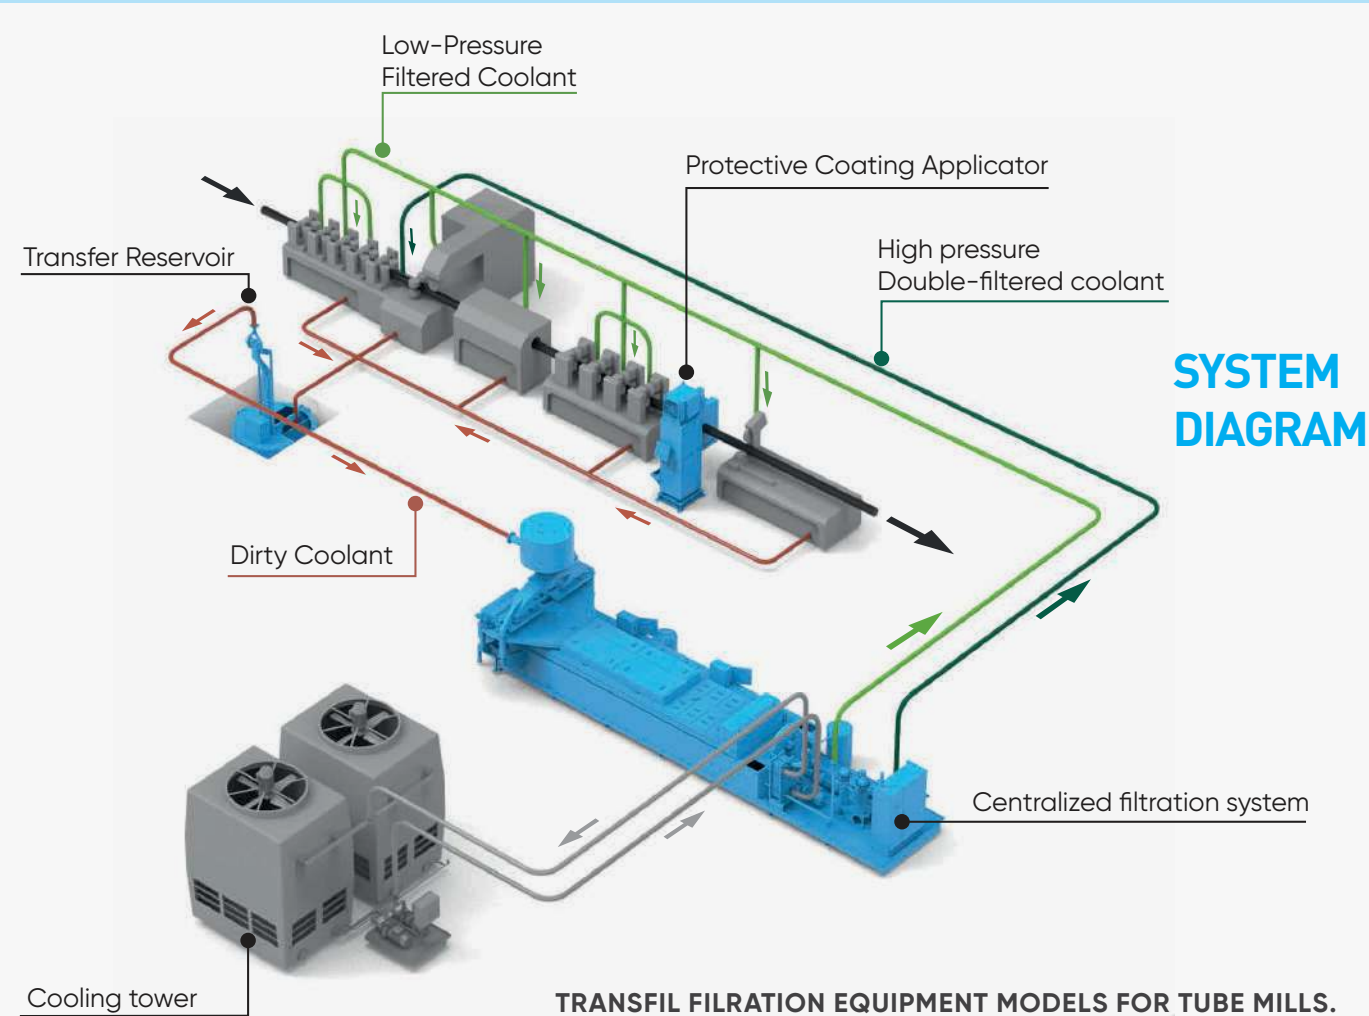

For seamless tubes manufacturing, efficient transportation of chips and coolant fluids from mills to central points is paramount.

Tailored specifically for such machinery, our solutions feature cutting-edge unification and transfer systems seamlessly integrated into the production line.

Selecting the right system hinges on various factors including factory layout, machinery specifications, induction welding, material handling, chip production volume, and optimal process temperature. Additionally, considerations such as automation level, flexibility, environmental compliance, disposal costs, and budgetary constraints are crucial.

TRANS-FIL, your Trusted Partner in Filtration Solutions.

From planning to setup, we deliver comprehensive solutions tailored to your needs.

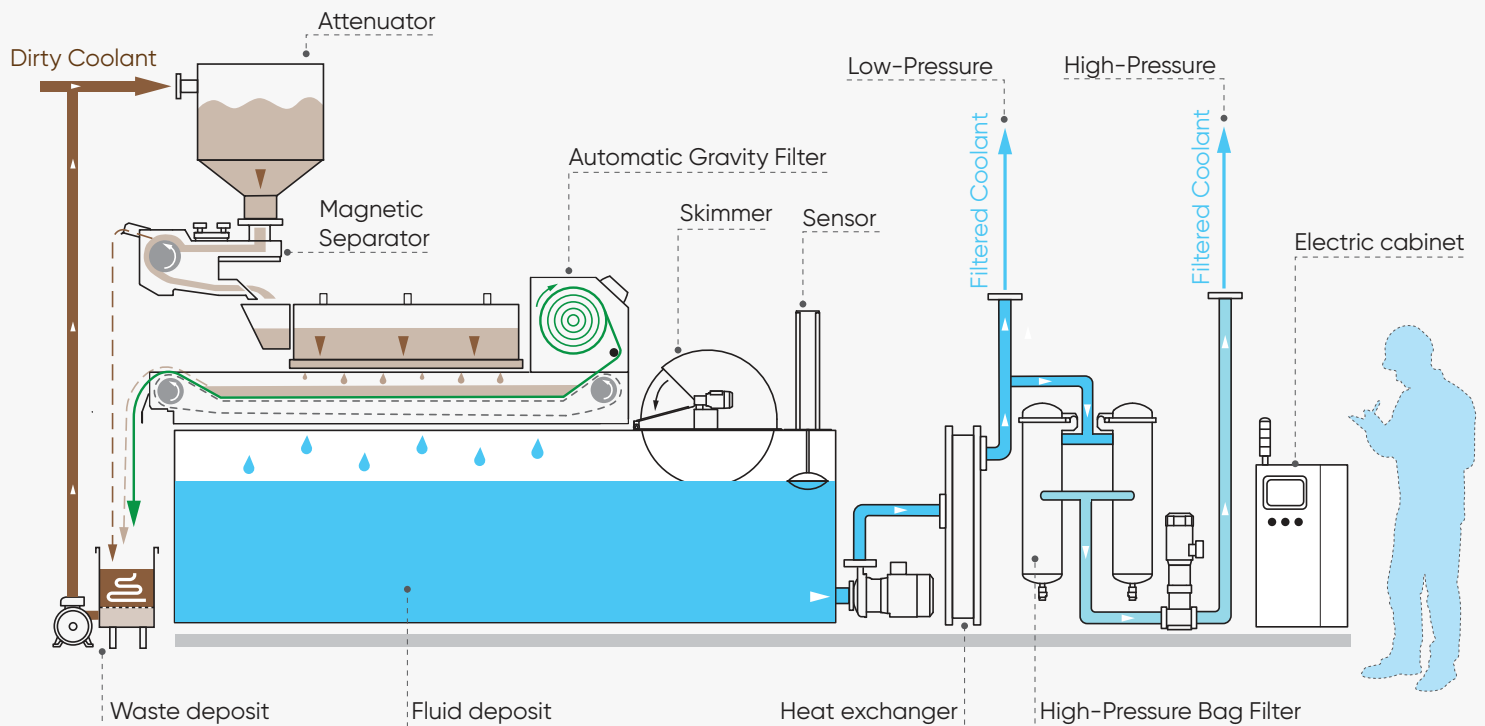

TRANSFIL FILTRATION EQUIPMENT MODELS FOR TUBE MILLS.

MODEL	FLOW RATE	MACHINES SERVED IN PARALLEL
CF-450 A	300-450 LPM	1-2
CF-800 C	600-800 LPM	1-3
CF-1400 D	1000-1400 LPM	2-4

*Images and layout are arranged for schematic purposes. Dimensions and proportions may vary depending on the specific application.

WORKING SCHEMATICS

Optimizing Tube-Mill Operations: The Imperative of Proper Filtration.

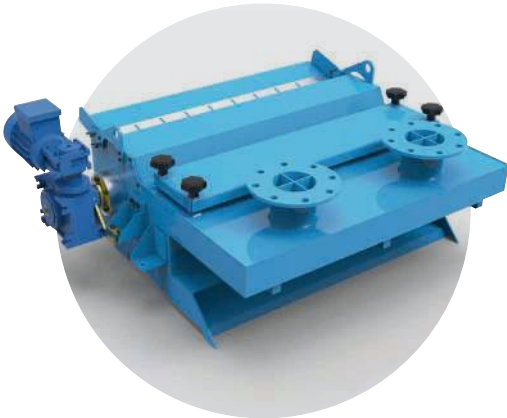

Tube forming is a precision-driven industrial process that requires meticulous attention to quality.

Proper filtration is crucial for eliminating impurities and waste from coolant fluids, playing a pivotal role in:

- Ensuring proper impeder function.
- Eliminating chips and calamine from the finished product.
- Protecting machinery components.
- Preventing defects in the final product.

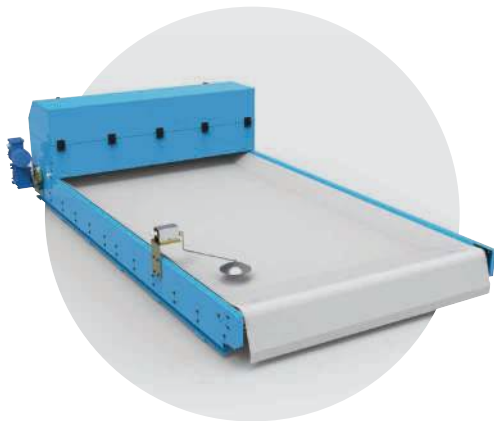

Insight into Our Machinery Technologies

Magnetic Separator

This device utilizes powerful magnets to capture magnetizable particles suspended in the coolant fluid. Serving as an efficient probabilistic filter, it functions as the initial stage of the filtration process.

Automatic Filter

This device comprises a robust and efficient gravity filter designed to capture particles suspended in the coolant fluid. The fluid traverses a filtration medium until saturation, at which point special sensors and a motorized system introduce a new layer of filtration element. Meanwhile, the saturated element is automatically deposited into a waste receptacle.

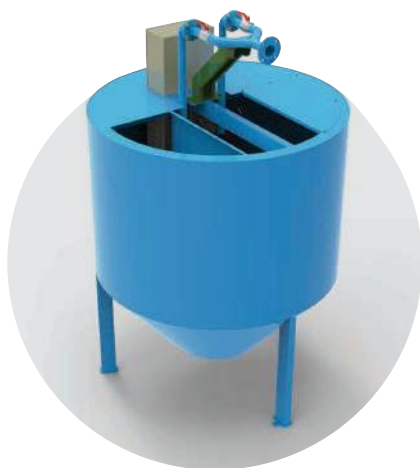

Oil Separator

Enhancing your tube forming process, our skimmer effortlessly eliminates floating oils from the coolant fluid. Featuring a spinning disk with specialized plastic layers, it diligently collects and separates oils from the surface of your coolant.

High-Pressure Bag Filter

Essential for the proper functioning of impellers. During filtration, the fluid is forced through the pores of a filtration element, reducing the filtration surface. Saturation of the filter causes a pressure differential before and after filtration, which is monitored by a barometer. When the differential reaches a certain value, the filtration element is replaced.

Transfer Reservoir

Essential fluid storage for pumping fluid from one or multiple machines to the centralized system.

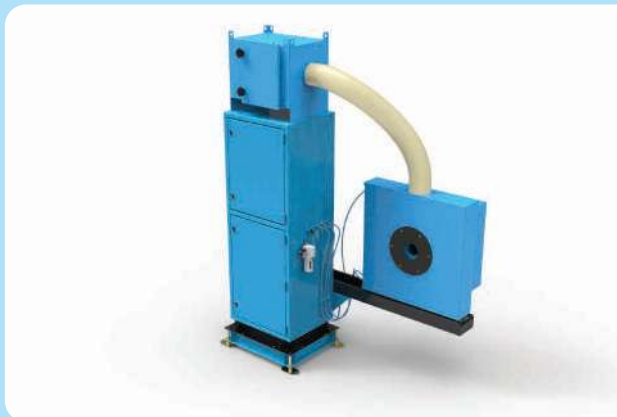

SYSTEM ENHANCEMENTS: FREQUENTLY INCLUDED ADD-ONS

Dosifier:

TRANS-FIL dosifiers ensure precise coolant concentration in the filtration process. Equipped with a probe in the fluid reservoir, they automatically measure coolant proportions and dispense additional coolant as needed during the process.

Protective Coating Applicator:

Experience our cutting-edge automatic protective applier, meticulously crafted to coat finished tubes. With adjustable laminar injectors, strategically positioned, we guarantee full surface coverage,

SPARE PARTS AND REPLACEMENTS:

Within our filtration systems, specialized replaceable elements are vital for optimal performance, requiring periodic changes to remove process residues. Through our extensive global supply network, we guarantee prompt and efficient delivery of these elements, ensuring uninterrupted support for all our clients whenever the need arises.

In TRANS-FIL,
we deeply value the long-standing relationships
we've built with our clients over the years.
